branch of physics known as classical mechanics. Bike motions of interest include balancing, steering, braking, accelerating, suspension activation, and vibration. The study of these motions began in the late 19th century and continues today.

Bicycle and motorcycle dynamics - Wikipedia
The steer tilt is $\theta/2$ minus the conventional "head angle"; a bicycle with head angle of 72° has $\theta = 18^\circ = \theta/10$. The steer axis location is implicitly defined by the wheel base w , trail t , and steer axis tilt angle θ . Two non-design parameters are the downwards gravitational

Start with the 24 degrees of freedom of the 4 rigid bodies, each with 3 translational and 3 rotational degrees of freedom in physical space ($4 \times (3 + 3) = 24$). Then subtract out 5 degrees of freedom for each of the three hinges and one more for each wheel touching the ground plane: $24 - 3 \times 5 - 2 = 7$.

An advanced model of bicycle dynamics
Over the past 140 years, scores of other
people have studied bicycle dynamics, either
for a dissertation, a hobby or sometimes as
part of a life's work on vehicles. This
sparse and varied research on the dynamics of
bicycles modelled as linked rigid bodies was
initially reviewed in Hand (1988).
