 The slope of the first drop that will be the most thrilling (without being dangerous) is -1.5. You decide to connect these two straight stretches, y = L1 and y = L2, with a parabola of the form y = f(x) = ax² + bx + c, where x and f(x) are measured in meters.

y' = 2ax + b. The origin is also on the parabola and at x=0 the tangent line has slope 0.7. Then c=0, so the parabola becomes y = ax² + bx, with the same derivative. So then 0.7 = 2a(0) + b <- first derivative of the parabola must be 0.7 at x=0. b = 0.7. The updated equation of the parabola is now y = ax² + 0.7x.

Roller Coasters Need Calculus Too! Abstract - Using the specifications of the given launch roller coaster, we were able to determine the position vector of the roller coaster as a function of time. After determining the position function, we took the derivative of this function to calculate the velocity of the coaster as a function of time.
