Although it can be built with two AND and one OR function block, the XOR block is also provided as a function block itself in Siemens TIA Portal, Codesys and many more. It is widely used to check if one and only one of two inputs are true. NAND, NOR etc. The next two function blocks are also build using the basic blocks. They are negated blocks. It actually just means that the output of the block is negated.

What's a function block? Siemens uses the term Function Block (FB) for program routines that can have internal memory, as opposed to Function Calls (FC) that have only temporary internal memory. Function blocks are a fundamental concept in the Siemens platform, which give them a significant advantage for large, modular applications.

One other advantage of FB over FC (from STEP7 programming perspective) is passing the parameters in/out to the function. In FC the calling block push the variable into OBstack (limited in size) where with FBs, variable are passed using instance DB. This is done in STEP7 language editors (STL, LAD) using AR2 register behind the scene. Dec: Suggestion
