This text describes the functions that the BIOS controls and how these relate to the hardware in a PC. It covers the CMOS and chipset set-up options found in most common modern BIOSs. It also features tables listing error codes needed to troubleshoot problems caused by the BIOS.

This book provides everything you need to manage and maintain Windows 7. You'll learn all of the features and enhancements in complete detail, along with specifics for configuring the operating system to put you in full control. Bestselling author and Windows expert William Stanek doesn't just show you the steps you need to follow, he also tells you how features work, why they work, and how you can customize them to meet your needs. Learn how to squeeze every bit of power out of Windows 7 to take full advantage of its features and programs. Set up, customize, and tune Windows 7-Optimize its appearance and performance, install and manage software, customize your hardware, and install printers,

scanners, and faxes Manage your files and data-Search your computer more efficiently, secure your data, share and collaborate, and get the most out of optional programs such as Windows Live Mail Master your digital media>Create media libraries, manage digital pictures and videos, make DVDs, and create movies Get connected and start networking-Set up a home or small-office network, conquer Internet Explorer, and master on-the-go networking Protect your computer-Keep your family safe while on the Internet, navigate the computer security maze, and configure Windows 7's protection features Manage and support Windows 7 systems-Configure user accounts, disks and drives, troubleshoot and handle routine maintenance, and resolve advanced support and recovery issues Learn advanced tips & techniques-Manage the Windows boot environment, explore Group Policy, and much more

Public relations and the media are in a time of major change. The rise of social media, altered media platforms, evolving legislative environments and new models of communication have altered not only the working environments of public relations and the news and entertainment media, but also many aspects of how these industries work together. Media Relations provides a practical and thorough introduction to media work in this changing environment. Based on a solid understanding of media culture and theory, Jane Johnston shows how to steer a path between the technical and human elements of media relations. She drills down into the different types of media, analysing their applications, strengths and weaknesses, and shows how to target your message to the right media outlets, whether national television, community radio, celebrity magazines or influential blogs. This second edition has been revised throughout and includes new case studies, and new chapters on digital and social media, media campaigns, and legal and ethical considerations. 'Media Relations: Issues and Strategies is written in an engaging, easy to understand style. It provides excellent examples and cases of media relations.' - Global Media Journal

ROSAT observation is presented of the edge-on spiral galaxy NGC 4631, a nearby Sc/SBd galaxy best known for its extended radio halo. Because of the low foreground Galactic X-ray-absorbing gas column density, $N(\text{sub H})$ approximately $1.4 \times 10^{20} \text{cm}^{-2}$, this observation is sensitive to gas of temperature greater than or equal to a few times 10^5K . A soft (approximately 0.25 keV) X-ray radiation out to more than 8 kpc above the midplane of the galaxy was detected. The strongest X-ray emission in the halo is above the central disk, a region of about 3 kpc radius which shows high star formation activity. The X-ray emission in the halo is bordered by two extended filaments of radio continuum emission. Diffuse X-ray emission from hot gas in the galaxy's disk was found. The spectrum of the radiation can be characterized by a thermal plasma with a temperature of $3 \times 10^6 \text{K}$ and a radiative cooling rate of approximately $8 \times 10^{39} \text{ergs s}^{-1}$. This rate is only a few percent of the estimated supernova energy release in the interstellar medium of the galaxy. Analysis of the X-ray spectrum shows evidence for the presence of a cooler (several times 10^5K) halo gas component that could consume a much larger fraction of the supernova energy. Strong evidence was found for disk/halo interaction. Hot gas apparently blows out from supershells in the galaxy's disk at a rate of approximately $1 \text{solar mass yr}^{-1}$. This outflow of hot gas drags magnetic field lines up in the halo and forms a magnetized gaseous halo. If the magnetic field lines are still anchored to the disk gas at large disk radii, the outflowing gas may be confined high above the disk by magnetic pressure. A strong X-ray source which coincides spatially with an H I supershell has been identified. However, the source is likely an extremely luminous X-ray binary with $L(\text{sub chi})(0.1 - 2 \text{keV})$ approximately $5 \times 10^{39} \text{ergs s}^{-1}$, which makes it a stellar mass black hole candidate.
